

Configuring Axxon domains

A distributed system based on the Axxon Next software package is created within an Axxon Domain, i.e., a selected group of Axxon Next Servers.

When configuring Axxon Domains, the following operations are used in the necessary combinations:

1. Creating a new domain
2. Adding a Server to an existing Axxon Domain
3. Excluding a Server from the current Axxon Domain

To configure Axxon Domains, you must have the appropriate permissions (see the section [Configuring user permissions](#)).

This section gives step-by-step instructions for each operation used in configuring Axxon Domains, and then describes typical instances of their use.
